AFFECTED APIS	Admin GraphQL API
---------------	-------------------

We're consolidating how in-progress inventory holds are represented. Inventory that was previously tracked under the `reserved` quantity state for draft orders, transfers, and shipments is being moved to the `committed` quantity state.

This change aligns these holds with how order inventory is already represented, so that `committed` reflects all inventory that is spoken for but not yet fulfilled.

What's changing

- For draft orders, transfers, and shipments, quantities that previously appeared under `reserved` will now appear under `committed`.
- This is a one-time data migration that applies only to active draft orders and open transfers/shipments that are still holding inventory when the change runs.
- Completed, cancelled, or already-released holds are not modified, because they no longer hold reserved inventory.

What's not changing

- `available` and `on_hand` quantities are unaffected. Total inventory is unchanged, and quantities are only moving between two “unavailable” buckets.
- Both `reserved` and `committed` remain valid, queryable quantity names. No fields are removed or renamed.
- Sellable inventory (`available`) is not affected, so this does not change what buyers can purchase.

What you may need to do

- If your app reads `InventoryLevel.quantities(names: ["reserved"])`, expect `reserved` values to decrease for affected shops, with a corresponding increase in `committed`.
- If you currently rely on `reserved` to detect draft-order or transfer/shipment holds specifically, you should read `committed` instead going forward.
- No code changes are required to keep existing queries working; only the values shift between the two states.

Reporting note

Merchants using inventory adjustment reports (for example, reports that break out adjustments by inventory state) will see `reserved` values migrate to `committed`, plus a one-time correction entry when the migration runs. This correction only covers active draft orders and open transfers/shipments at the time of migration. `on_hand` and `available` totals are unchanged, and historical data before the migration remains as-is.
